

# Knight Redi-Filter System

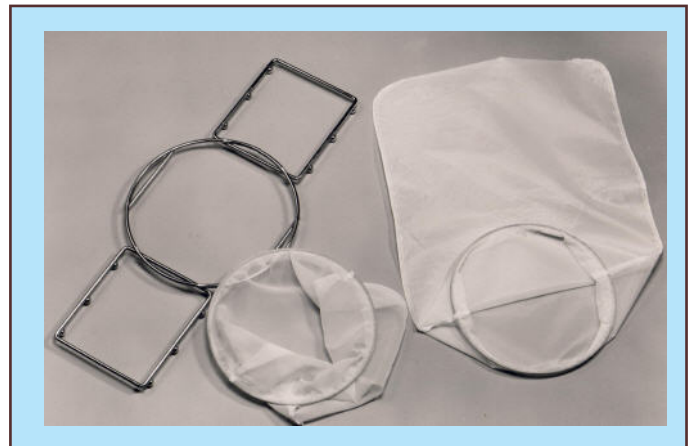

## WHAT IS IT?

The Redi-Filter is a steel rack that is designed to hold Knight Filter Bags. It fits on anything from a 5 gallon paint can to a 55 gallon drum, and has knobs to prevent lateral movement.

## HOW IT WORKS?

Liquid is poured through the filter, into the can. When the operation is complete, both the rack and filter bag can be removed, cleaned, and placed on another can -- ready for the next job!

The standard filter for use with the Redi-Rack is 10" diameter x 9" long (that's 4.4 square feet of filter area). However, larger bags of any material or micron can be purchased.

The Knight Redi-Filter System is a unique way to solve filtration problems, either on new applications or by replacing the tie-on to pipe bag.

The Knight Redi-Filter System is easy to use, saves you time, and saves you money!
